

Service Sphere

Your orbit to assistance

About ServiceSphere

ServiceSphere is an innovative web application designed to connect individuals offering services with those seeking assistance. The platform caters to a wide range of needs, including household chores, cooking, and maintenance tasks, with a special emphasis on accessibility for people with disabilities and those needing help due to fatigue, time constraints, or specialized requirements like painting and repairs.

Current Challenges:

Difficulty in finding reliable part-time helpers for tasks like cooking, household chores, or other services.

Lack of a unified platform to connect helpers with those in need.

Proposed Solution:

Build a web application that bridges the gap by providing an easy-to-use platform where :

- Helpers can list their services and relevant details.
- Customers can search, book, and review services
- Admins can monitor and manage platform activities.

USERS AND CORE FUNCTIONALITIES

Admin Functionalities

- Add and manage services on the platform with flexible pricing.
- Approve or reject helper registrations based on uploaded certifications.
- Monitor platform earnings and analyze helper performance statistics.
- Receive and manage messages from both helpers and seekers through the contact page.

Helper Functionalities

- Register and manage personal profiles with service selections and certifications.
- Accept or reject service requests from seekers.
- View a schedule calendar (monthly, weekly, daily) showing all accepted bookings.
- Track income through the earnings dashboard.
- Access a feedback section to view reviews from serviced seekers.

Seeker Functionalities

- Log in to browse and filter available services and helpers.
- Book services by selecting date and time preferences.
- Make payments once the helper accepts the request.
- Submit service reviews and view previous or upcoming bookings in the cart.
- Edit and manage their personal profile details.

Overall Platform Highlights

- Seamless integration between Admin, Helper, and Seeker dashboards.
- Dynamic data handling using Fetch and async operations for real-time updates.
- Role-based workflows ensuring smooth service discovery, booking, and management.

User Journey

01

Helper Onboarding

The journey begins with the Helper registering on the platform, providing essential information such as name, email, and service details.

02

Service Setup

After registration, the Helper adds specific service offerings, sets their availability, and establishes an hourly rate, ensuring they are ready to assist Seekers.

03

Service Requests

Once set up, the Helper can view incoming service requests from Seekers, allowing them to manage their workload effectively and respond to potential bookings.

04

Feedback and Improvement

After completing a service, the Helper receives feedback from Seekers, which helps them improve their offerings and maintain a high-quality service standard on the platform.

System Workflow

Future Scope

- React Integration: Build a dynamic and interactive front-end.
- Redux: Manage application state effectively.
- RESTful APIs: Develop robust APIs for frontend-backend communication.
- Admin Dashboard: Advanced analytics and monitoring.
- Payment Gateway: Seamless booking payments.

Revenue Model

- ☐ **Subscription Plans**
- ☐ **Commission-Based Earnings**
- ☐ **Advertising Revenue**
- ☐ **API Access for Partner Businesses**

Individual Contributions

Jahnavi P

Handled the admin dashboard, managing users, services, and earnings analytics.

Bhavishya C

Created the search functionality and previous bookings overview

Saranya Y

Implemented the booking workflow, cart, payment, and review system

Rithika P

Built the helper dashboard with profile, requests, schedule, and feedback features.

Sarayu M

Developed the home page and all authentication pages (login/signup).

THANK
YOU!
